

OmniPay-SagePay

Sagepay-Server PAYMENT/DEFERRED/AUTHENTICATE Success Path

You cannot start a transaction without sending valid user details.

Access to the basket needed to process on final return

The VendorTxCode is used to index the storage of every data structure past this point and will be sent with all messages.

PAYMENT, DEFERRED or AUTHENTICATE

Start the interchange with the notification callback outside the user's session.

Saved in the user's session.

Use `getStatus()` to check for OK, AUTHORISED or REGISTERED.

This is how the final confirmation page gets to hear the result.

Process the basket, assuming we have a link to it. Only do quick actions here as the notification callback does not have time to waste. Includes "Order Complete" redirect URL

SagePay will add no GET parameters of its own. The VendorTxCode should be in the session so that does not need to be sent.

Handle the basket processing if not done in the notification callback. There is some risk leaving it until now, in case the user doesn't make it here.

Everything should be paid/authed and in process.
